

Q4. Transpiration is the loss of water in the form of water vapour from the leaves of a plant through the stomata. High temperature and moving wind both increase the rate of transpiration.

Q1. Photosynthesis is the process by which green plants prepare their own food using sunlight, carbon dioxide and water in the chloroplast.

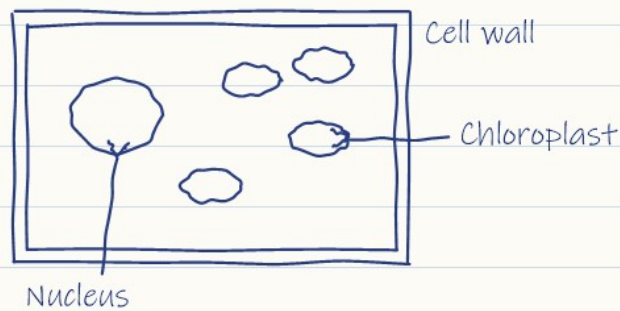

Q2. The human heart is a muscular organ which pumps blood to the whole body. It has four chambers - the right atrium, right ventricle, left atrium and left ventricle. The diagram is drawn below.

(continued on next page)

The right side of the heart carries deoxygenated blood to the lungs and the left side pumps the oxygenated blood into the aorta, which carries it to the rest of the body. Valves stop the blood from flowing backwards.

Q6. A plant cell has a cell wall outside the cell membrane. The chloroplast contains chlorophyll.

Q5 (a). Tidal volume is the volume of air breathed in or out during one normal quiet breath.

The mitochondria is the powerhouse of the cell and it releases energy during respiration.
